

## TABLES AND FIGURES

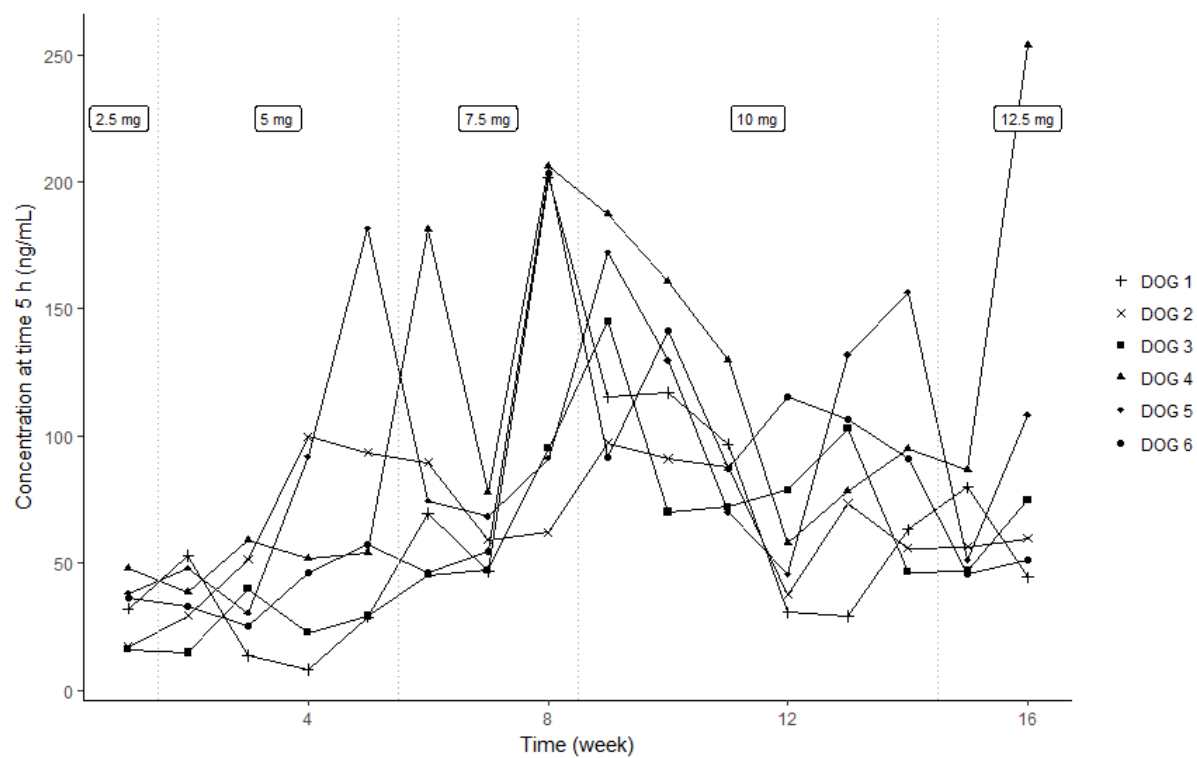

Figure 1: MTX Plasma concentration versus time curves at time 5 hours, when concentrations were shown to be the most strongly correlated to AUC, during the DE-Study. Actual administered doses (from 2.5 to 12.5 mg in toto) are indicated between dotted lines.

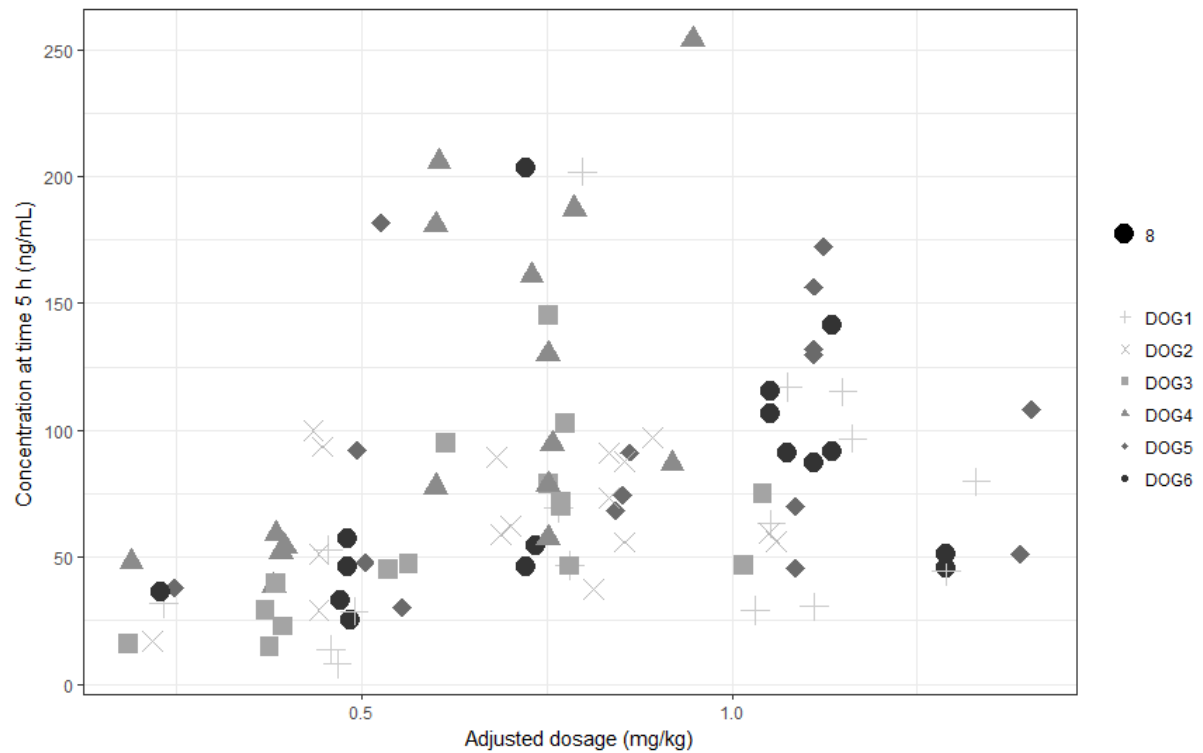

Figure 2: Individual MTX plasma concentration versus adjusted dosage (i.e. fixed dose divided by body weight for each dog along the study) at time 5 hours obtained during the 15 week-dose escalation study.
